Nikita Petrich

Senior Full-Stack & AI Engineer

Tel: +49 15679088678 **Mail:** n.petrich@sequenz.io **Web:** sequenz.io

Location: Remote · Munich (max. 1-2 days onsite) **Experience:** 7+ years

Available: immediately · full-time (full capacity) **Rate:** €80/hour

Cert.: IHK-certified IT Specialist (Application Development)

FOCUS

LLM Integration RAG AI-powered Automation Agentic Coding / AI-Engineering TypeScript Python
Backend (NestJS · Node.js · FastAPI) Frontend (Next.js · React · Angular) PostgreSQL Clean Architecture
Microservices CI/CD Docker GDPR-compliant AI architecture

LANGUAGES

German · Native English · B2 · US/EU remote team experience

HOW I WORK

results-oriented self-reliant & dependable autonomous, asynchronous way of working
clear communication (DE/EN)

PROFILES

Website LinkedIn GitHub freelancermap Malt

- I'm a freelance Senior Full-Stack & AI Engineer. My focus is AI: **LLM Integration**, **RAG** and **AI-powered Automation** that make it into production — from architecture and integration through to stable operation.
I'm equally at home in classic full-stack development — whether a complete application, pure backend (**NestJS**, **Node.js**, **FastAPI**) or pure frontend (**Next.js**, **React**, **Angular**). Robust APIs, cleanly structured architecture (**Clean Architecture**, **Microservices**) and maintainable, tested code are standard; I factor in data protection from day one — **GDPR-compliant** and **Secure by Design** on European infrastructure.
I work consistently with modern **Agentic Coding** and **AI-Engineering** workflows and tools (**Claude Code**, **Cursor**, **Code Rabbit**) — for exceptionally high productivity at consistent quality.
Over more than seven years I've delivered applications in **LegalTech**, **HealthTech**, **E-Commerce/Retail**, **EdTech** and **Logistics** — from AI platforms with several thousand users to business-critical enterprise applications.
Planning an AI initiative or a product that has to run reliably? Book a free intro call: calendly.com/nikita-petrich/30min

PROJECT OVERVIEW

01	BESCHIEDKLAR Founder & CTO	LegalTech / GovTech	04/2025 – present ~15 months
02	Manifest OS Full-Stack (AI features)	LegalTech / Immigration	12/2025 – 04/2026 ~5 months
03	AITOI Frontend Engineer	IoT / Consumer Electronics	08/2025 – 09/2025 ~2 months
04	DiNo Frontend	LegalTech / Notary	01/2025 – 05/2025 ~5 months
05	AccountingOS Sole Developer	Retail & Automotive (ERP)	01/2024 – 12/2024 ~12 months
06	Truck Tour-Management System Sole Developer	Logistics & Transport	02/2021 – 05/2023 ~2 years 4 months
07	XU Navigator Full-Stack	EdTech / E-Learning	05/2020 – 02/2023 ~2 years 10 months
08	Medical Device Management System Full-Stack	HealthTech / Medical Technology	01/2019 – 05/2020 ~1 year 5 months

Skills & Expertise

A complete overview of my technical competencies

BESCHEIDKLAR — AI-powered LegalTech SaaS Platform

Founder & CTO

Screenshot: AI pre-assessment dashboard for official notices

Team: Solo (sole developer) · own product (part-time)**Location:** Lower Saxony, Germany · Remote**Project language:** German**Website:** bescheidklar.de**Methodology:** Self-directed · direct product ownership**RESPONSIBILITIES**

- Conceived and built a two-sided **LegalTech** SaaS platform with a modular, service-oriented architecture — combining AI-powered document analysis (**Azure OpenAI**) with a regional licensing model for law firms.
- Designed and implemented a multi-stage **AI pre-assessment pipeline** for official notices and terminations (extraction → deadline check → plausibility and success estimate) with a structured preparation of the case.
- Automated, **GDPR-compliant** handover of qualified leads (including uploaded or photographed documents, calculations and AI results) directly into the system of the matching specialists (lawyers, law clinics) — including contact data, so an immediately actionable mandate lead is created.
- Built an AI-powered advice section with **RAG-based** content preparation — articles and recommended actions for those affected (e.g. after a termination or a rejection notice).
- Coverage of several legal areas (civil, social and labor law) via an extensible, multilingual and low-barrier web interface.
- End-to-end ownership of architecture, tech stack, hosting on EU infrastructure and a Secure-by-Design compliance concept (**EU AI Act**, **GDPR**, **RDG**).
- Built type-safe end-to-end data flows (**TypeScript**, **DTOs**, **Zod**) with automated **CI/CD** delivery (**GitHub Actions**, **Docker**), monitoring/error tracking (**Sentry**) and test coverage (**Vitest**, **Playwright**).

RESULTS

- Addressable market: 188,522 licensed lawyers in Germany; a scalable model with minimal fixed costs.
- Target: up to 10,000 automated pre-assessments per month via AI-powered initial evaluation.
- Target: up to 80% less manual case intake through AI intake and automated lawyer routing.
- Target: a predictable inflow of pre-qualified mandates for connected firms instead of costly manual initial screening.

Manifest OS — AI-powered Immigration Platform

Full-Stack Engineer (AI feature integration)

Screenshot: B2X portal – case overview

Team: ~20 engineers · cross-functional work with product, design and tech leads**Location:** New York, USA · Remote**Project language:** English**Website:** manifestlaw.com**Methodology:** Scrum · autonomous way of working

RESPONSIBILITIES

- Independently implemented production AI features: **event-driven** enrichment of lawyers' intake-call leads — meeting recordings are transcribed via Bluedot and processed resiliently (retry, idempotency) through a **webhook**, a **BullMQ** queue and the OpenAI integration; structured results flow back into the core systems automatically.
- AI-powered evidence processing: uploaded case documents (e.g. ID scans, birth certificates, proofs) are automatically analyzed, classified and consistently named.
- Contributed to consolidating four separate portals (B2B, B2C, Lawyer, Ops) and one API into a unified **"B2X"** portal; owned the full-stack migration of the B2B and Ops areas, including merging the data model and UI.
- Introduced application-wide event tracking (**Amplitude**) to analyze user behavior — identifying weak spots and friction as a data basis for product and data analytics.
- Developed robust, **event-driven** backend services (**NestJS**, **BullMQ**) with retry, idempotency and error-handling strategies for reliable background processing.
- Implemented in a monorepo with clearly bounded feature modules for a fast future split into **microservices**, with type-safe interfaces (**TypeScript**, DTOs) and automated tests (**Jest**, **Playwright**) in the **CI/CD** process.
- Close collaboration in code reviews and use of AI-assisted tools (**Claude Code**, **Cursor AI**, **Code Rabbit**) to safeguard quality and development speed.

RESULTS

- Part of a roughly 20-person engineering team on an established platform (company valuation in the region of **USD 60M**).
- Platform with more than **3,000 customers** and 150+ corporate programs (team result).
- Up to 15% higher approval rates versus the USCIS average (team result).

AITOI — Interactive IoT Toy (MVP)

Frontend Engineer

Screenshot: PWA Wi-Fi onboarding flow

Team: Small interdisciplinary team incl. hardware development

Location: Frankfurt, Germany · Remote

Project language: German & English

Visibility: internal system (code not public)

Methodology: Self-directed · English-language coordination with the hardware team

RESPONSIBILITIES

- Conceived and implemented the IoT Wi-Fi onboarding of a connected AI toy via QR-code scan — including a guided setup flow, device pairing and robust error handling.
- Implemented the initial setup of new devices as well as later reconfiguration of settings via a platform-independent Progressive Web App (PWA).
- Integrated **Supabase** for authentication, data storage and real-time synchronization between device and app (including Row Level Security).
- Built a performant, platform-independent PWA architecture (**Next.js**) with a responsive UI.
- Defined and implemented type-safe data models and API interfaces (**TypeScript**, DTOs, Zod).
- Close, English-language coordination with the hardware team to define device-app communication and the setup protocols.
- Advised and guided the client from the first idea to an actionable **MVP** concept.

RESULTS

- Fully functional **MVP** frontend in about one month — delivered independently from concept to demo.
- Platform-independent PWA with real-time synchronization between the IoT device and the app.
- Scalable, documented architecture as a solid technical basis for the product launch.

LEGALTECH / NOTARY

01/2025 – 05/2025 · 5 MONTHS

04

DiNo — Digital Notary

Frontend Engineer

Screenshot: Client portal – case overview

Team: 2–4 people

Location: Oranienburg, Germany · Remote

Project language: German

Website: digitales-notariat.de

Methodology: Scrumban

RESPONSIBILITIES

- Implemented frontend features for digitizing notary processes with a focus on clear, comprehensible user guidance — including a client portal and a notary portal.
- Built digital case management: structured data capture, digital case files and seamless internal filing to speed up case processing.
- Extended a client portal for status tracking, secure document provision and data-protection-compliant communication.
- Implemented responsive interfaces (**React**, Material UI) for the client and notary portals.

RESULTS

- According to the vendor, up to 70% fewer phone inquiries from clients.
- According to the vendor, invoices are paid up to **30 days** earlier.
- Noticeably reduced administrative effort and greater transparency through consistently digital, traceable processes.

RETAIL & AUTOMOTIVE (ERP / INVENTORY)

01/2024 – 12/2024 · 12 MONTHS · ONGOING MAINTENANCE (PART-TIME)

05

AccountingOS — GoBD-compliant Accounting & Inventory System

Sole Developer · Full-Stack & AI

Screenshot: Inventory management & invoicing module

Team: Solo (sole developer) · client project

Location: Salzgitter, Germany · Remote

Project language: German

Code: github.com/nikita-petrich/accounting-os

Methodology: Self-directed

RESPONSIBILITIES

- Conceived and developed a feature-rich, **GoBD**-compliant accounting and inventory management system on a cleanly layered architecture (**Clean Architecture**).
- Designed and implemented a resilient data-synchronization service ("Pipe Service") that processes supplier catalogs (car spare parts) with up to **20 million** CSV rows over a TLS-encrypted connection — with queue, caching, retry logic, validation, deduplication and data cleansing.
- Built the accounting module: invoices, correction invoices, internal orders, PDF export, customer management, inventory management, order import with automatic order conversion, and **GoBD** write-once locking.
- Coupled inventory management to invoice management: automatic stock deduction on invoice line items and notification when the minimum stock level is undercut.
- Recursive resolution of foreign-key dependencies in the input dialogs for consistent master-data maintenance.
- Customer and master-data management with role-based access control (admin, staff, tax advisor) and authentication via **better-auth**.
- Technical advice for the client on solution approaches, architecture and process optimization.
- Built type-safe **GraphQL** and REST interfaces (**NestJS**) with validation, error handling and consistent data modeling (MikroORM, DTOs).
- Ongoing support (part-time): maintenance, security updates and further development.

RESULTS

- Saves up to **40 hours** of administrative work per month (up to **480 hours/year**).
- Reduces the time spent on routine processes such as invoicing and inventory management by up to 50%.
- End-to-end digital, **GoBD**-compliant workflows with a direct coupling of inventory and accounting.

Truck Tour-Management System

Sole Developer · Full-Stack & AI

Screenshot: Tour planning with real-time tracking

Team: Solo (sole developer) · client project

Location: Bremen, Germany · Remote

Project language: German

Website: cdh-stephanus.org

Methodology: Self-directed

RESPONSIBILITIES

- Independently conceived and developed a truck tour-management system for efficient control and optimization of tour planning.
- Implemented dynamic tour management to increase transport accuracy.
- Automated generation of PDF and DOCX documents from dynamic data, plus audit-proof digital archiving per tour.
- Built role-based access control and secure authentication (**better-auth**).
- Container-based, self-hosted deployment (**Docker**, Nginx) for a stable server environment.
- Technical advice for the client on solution approaches and architecture.
- Built type-safe backend services (**NestJS**) with clean layering (**Clean Architecture**) and consistent data modeling (MikroORM, DTOs).
- Ongoing support (part-time): maintenance, security updates and further development.

RESULTS

- Saves up to **1,000 hours** per year through automated document processes and noticeably lowers personnel costs.
- Increases transport accuracy by up to 25% and **logistics** efficiency by up to 30%.
- Significantly reduced transmission errors and costly rework through consistently digital processes.

EDTECH / E-LEARNING

05/2020 – 02/2023 · 2 YEARS 10 MONTHS

07

XU Navigator — Enterprise Learning Platform

Full-Stack Engineer

Screenshot: Course management & certificate engine

Team: 5–10 people

Location: Bremen, Germany · Remote

Project language: German

Website: xu.de

Methodology: Scrum

RESPONSIBILITIES

- Co-developed the “XU Navigator”, a scalable microservice learning platform for corporate employees — among others for customers such as Daimler, VW and ThyssenKrupp.
- Developed dynamically, tenant-specifically fillable course content (videos, podcasts, multiple-choice questions, articles) via clearly bounded services.
- Implemented learning-progress tracking including automatic certificate generation, plus an expert and community forum.
- Full-stack development across all platform modules in an agile Scrum team — from course management to the certificate engine, in frontend and backend.
- Developed scalable backend services (**NestJS**, **GraphQL**) with clearly bounded domains in a microservice architecture.
- Implemented responsive **Angular** interfaces (**Angular** Material, **NgRx**) with a focus on reusability and maintainability.
- Deployment via Azure (Azure DevOps Pipelines, **Docker**) with automated builds and deployments.

RESULTS

- Scalable microservice platform in productive use at well-known corporations (Daimler, VW, ThyssenKrupp and others).
- High degree of customization for tailored, company-specific training.
- Automated certificate issuance and progress analysis to increase completion rates.

TECHNOLOGIES

HEALTHTECH / MEDICAL TECHNOLOGY

01/2019 – 05/2020 · 1 YEAR 5 MONTHS

08

Medical Device Management System

Full-Stack Engineer

Screenshot: Device & maintenance-history overview

Team: 2–4 people

Location: Germany · On-site / Hybrid

Project language: German

Visibility: HealthTech project for a hospital chain (anonymized)

Methodology: Scrumban

RESPONSIBILITIES

- Co-developed all areas of a software system for managing medical devices across several hospitals — a tool for technicians to simplify maintenance and repair.
- Implemented device and master-data management (hospital, location, device specifications) on a cleanly layered architecture (**Clean Architecture**, Dependency Injection).
- Developed a detailed maintenance history (time and type of work performed) and device-related document management.
- Implemented incident capture by nursing staff for fast handover to the technical team.
- Implemented tenant-capable filtering by hospital (**multi-tenancy**) as well as Microsoft sign-in via O365 Identity.
- Developed a type-safe **REST API** (ASP.NET Core Web API, Swagger/OpenAPI) with clean layering and dependency injection.
- Data modeling and access with Entity Framework Core (code-first migrations) on MSSQL.
- Implemented responsive **React** interfaces (Fluent UI) and automated builds via Azure DevOps Pipelines.

RESULTS

- Delivered a complete, multi-tenant device management with maintenance history and document management.
- A structured technical basis for more efficient maintenance and repair processes for the technical team.
